

Unfortunately there is a problem with Crowdin which we could not solve yet. When we change something in a page or add just a little information some of the translations already done are „lost“ in Crowdin. Luckily they are not completely gone but need to be reactivated.

1. Click the sentence that has to be retranslated.
  2. Check if it says 100% match.
  3. If so you can click on the disc symbol on the right to save this already done translation.
- After that it has to be proofread again.

## Construire l'APK

**Please note** With AndroidAPS version 2.3 it is not possible to build the APK with the latest Android Studio version. Please use Android Studio 3.4 from [here](#).

**Please note** when building AndroidAPS 2.0 apk: **Configuration on demand** is not supported by the current version of the Android Gradle plugin!

Si votre construction échoue avec une erreur concernant la "configuration sur demande", faites les actions suivantes :

- Open the Preferences window by clicking File > Settings (on Mac, Android Studio > Preferences).
- In the left pane, click Build, Execution, Deployment > Compiler.
- Uncheck the Configure on demand checkbox.
- Click Apply or OK.

### Cet article est divisé en deux parties.

- In the overview part there is an explanation on what steps are necessary to build the APK file.
- In the step by step walkthrough part you will find the screenshots of a concrete installation. Because the versions of Android Studio - the software development environment which we will use to build the APK - will change very quickly this will be not identical to your installation but it should give you a good starting point. Android Studio also runs on Windows, Mac OS X and Linux and there might be small differences in some aspects between each platform. If you find that something important is wrong or missing, please inform the facebook group "AndroidAPS users" or in the Gitter chats [Android APS](#) or [AndroidAPSwiki](#) so that we can have a look at this.

### Aperçu

In general, the steps necessary to build the APK file:

1. **Install git**
2. **Install and setup Android Studio.**
3. **Use git to clone the source code from the central Github repository where the developers have put**

SOURCE STRING

Install git
